

**We have 4 group people
A, B, C, D**

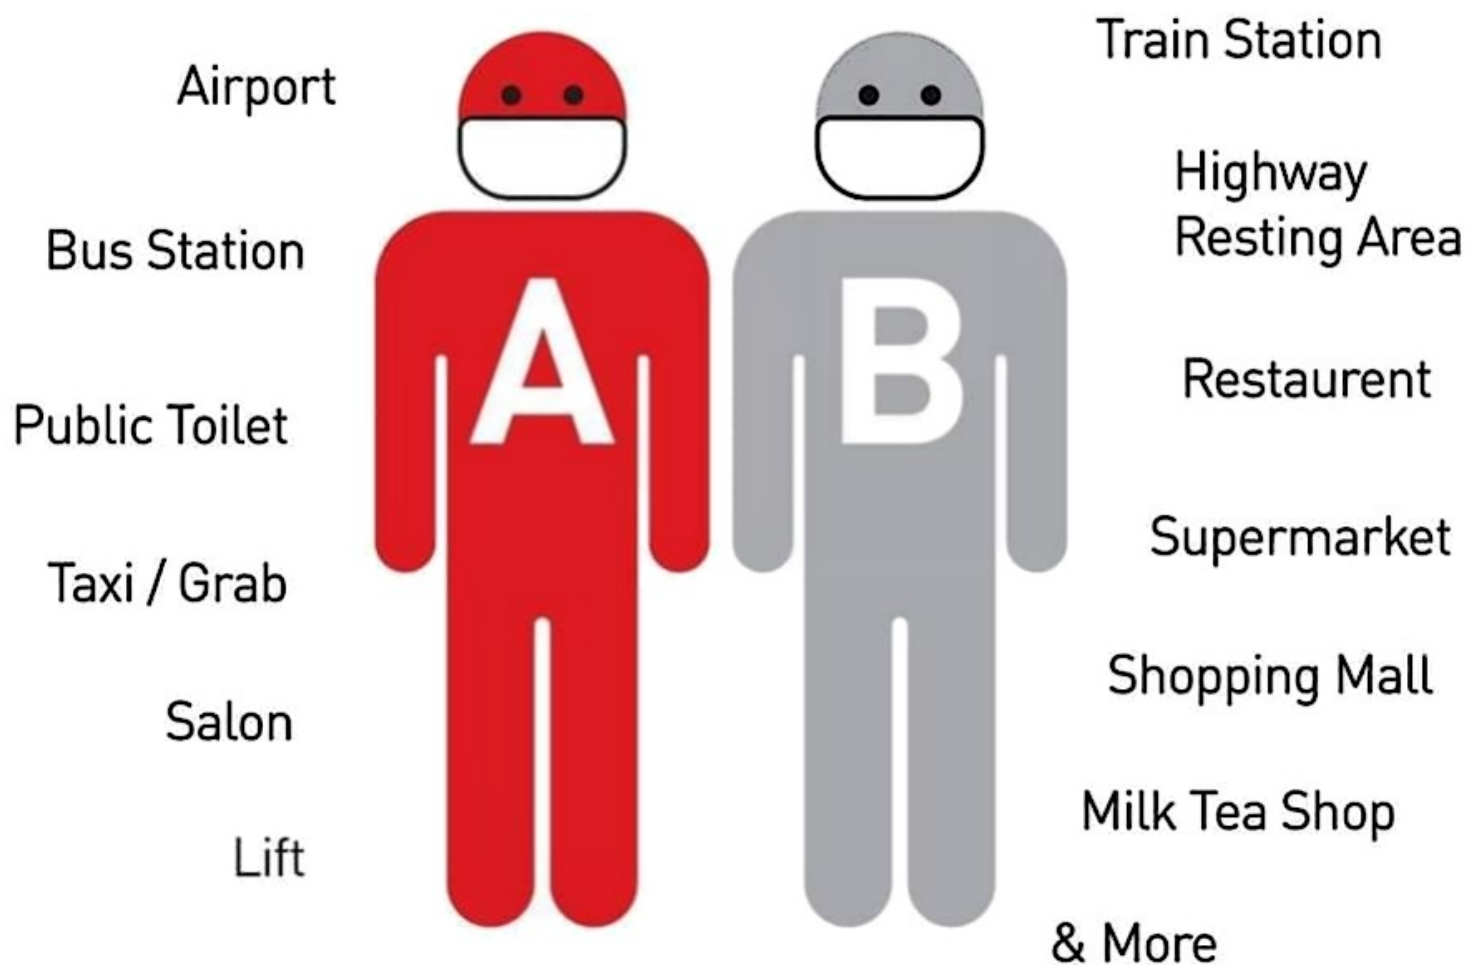

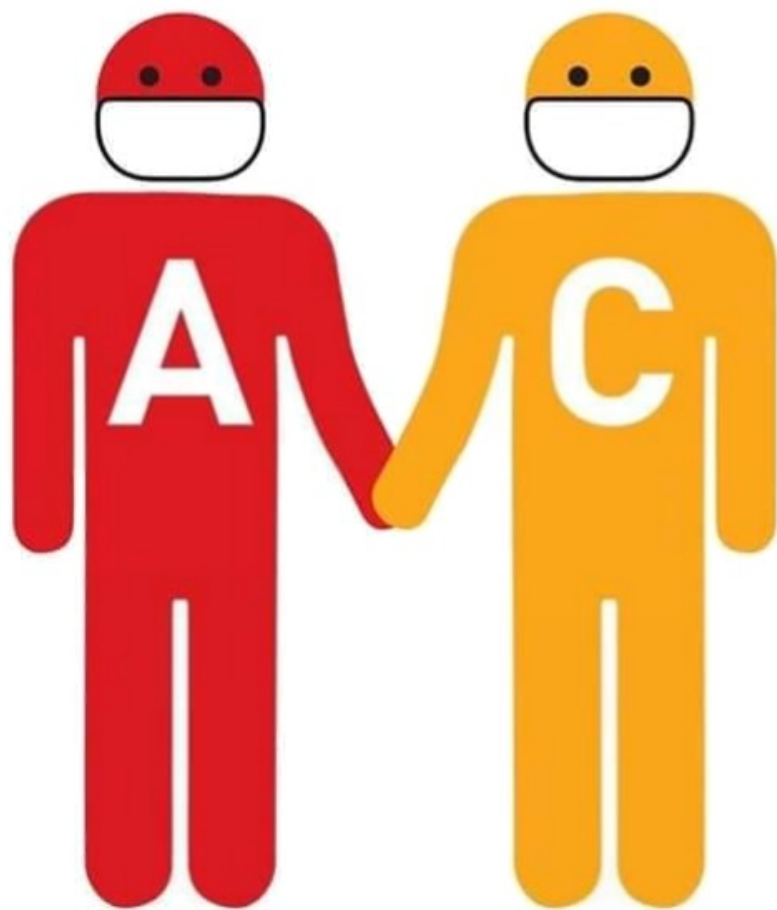

A: The first carrier
They are easy to find,
and mostly in cure.

**A go out to find C,
passby stranger B in public,
A & B dont know each other.**

**A arrive and contact with C.
No matter how many C,
we can find them.**

Quarantined & Obsevered

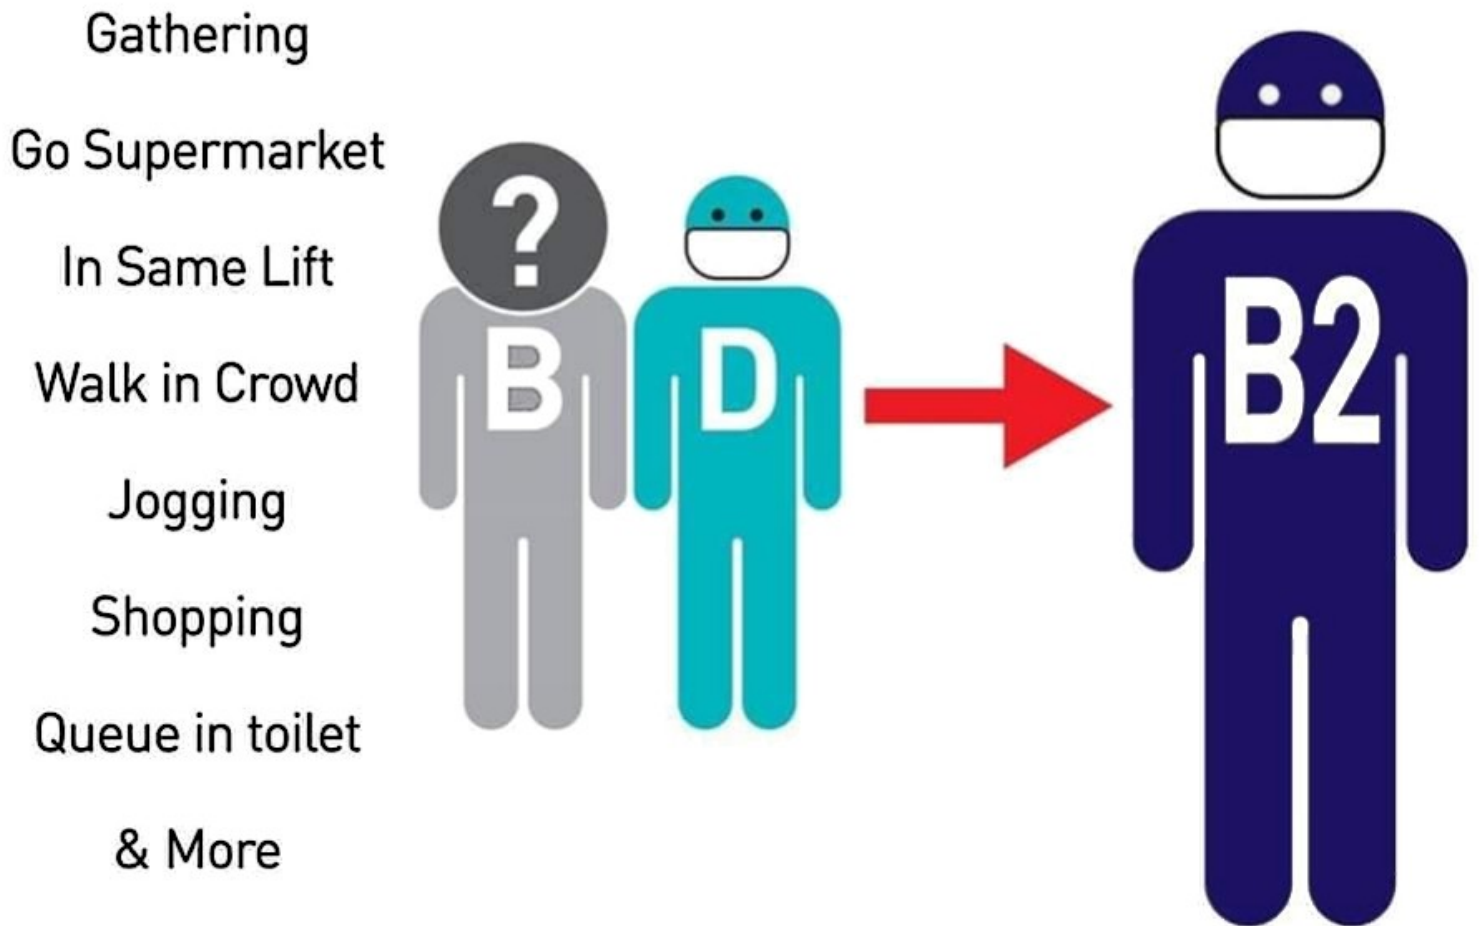

D stay in home & never go out

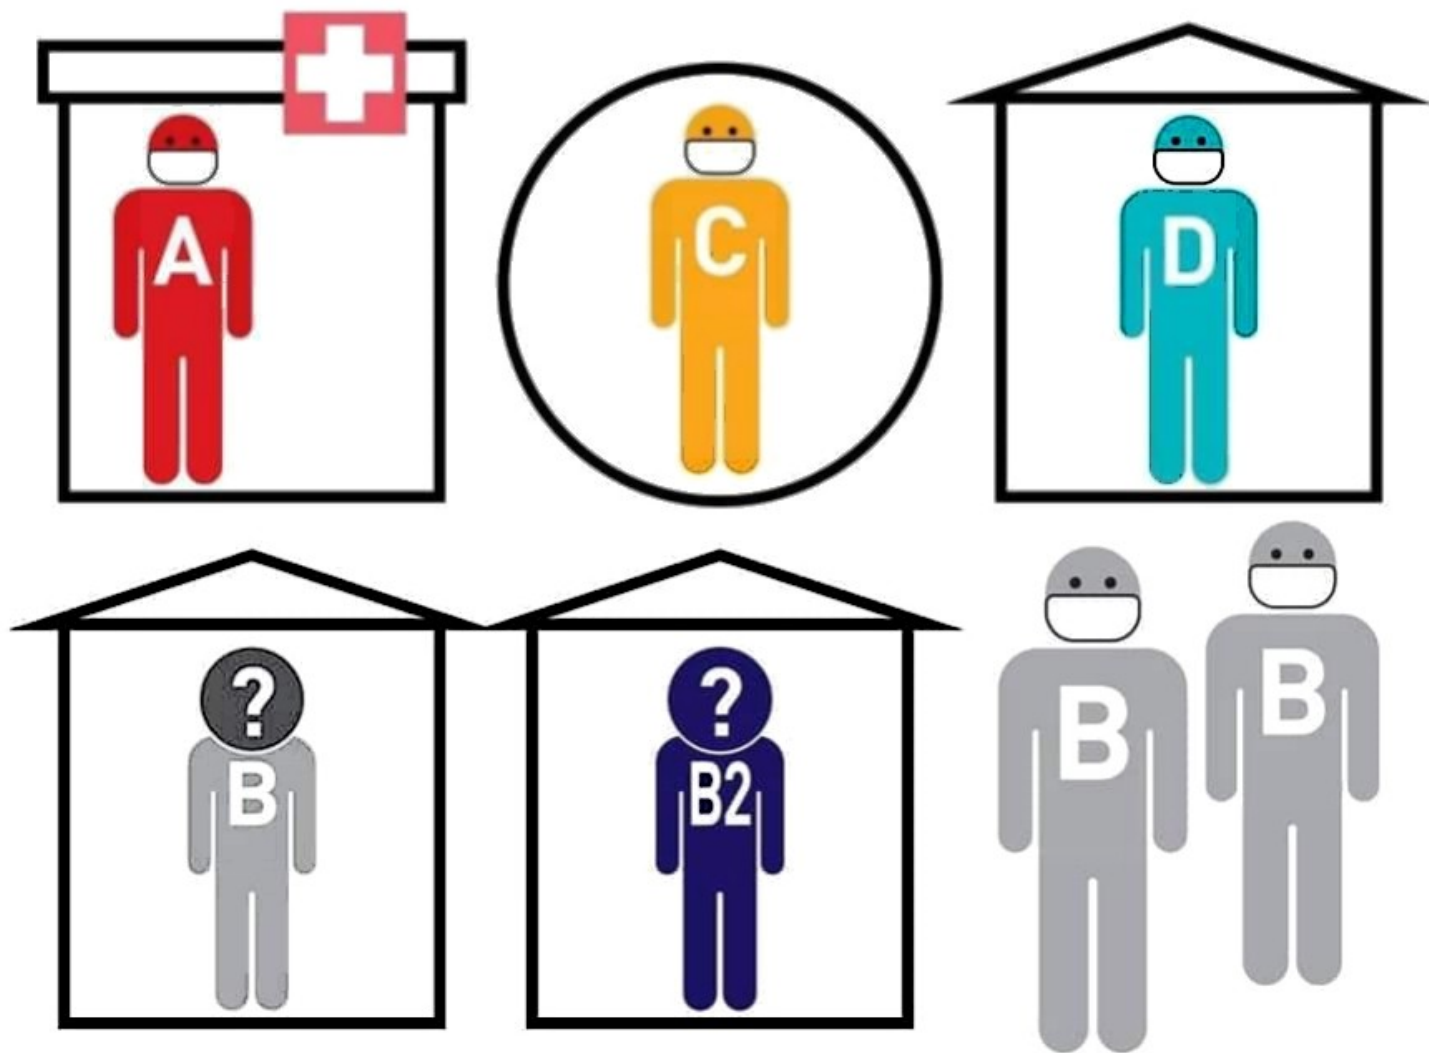

**The problem is, we can't find
B. Nobody know who is B,
including B themselves**

**Once D go out, he/she might
contact / meet / passby B.
Now D became new B (B2)**

The objective of lockdown & quarantine citizen is using time to find out Group B.

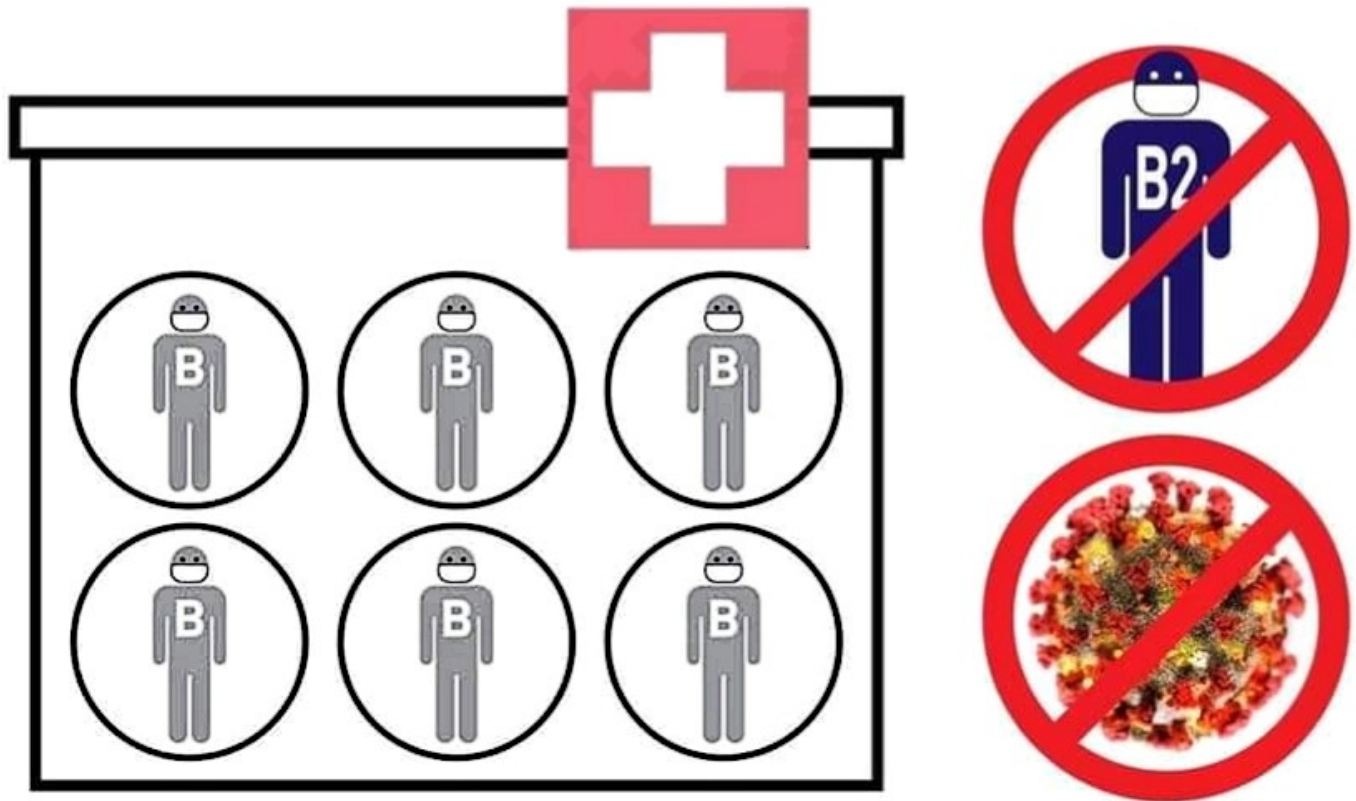

Basically incubation period is 2 weeks. Within 2 weeks, Group B will show symptoms.

By this method, we can

- Find out Group B. Quarantine & treatment applied.
- Reduce & stop B2.
- Until stop the transmission.

One person can make a huge difference.
Step back. Stay home. Slow the spread.
